

ABSTRACT

The invention relates to curable resin
5 compositions based on an unsaturated prepolymer, a
vinyl ether monomer that can be cross-linked with it
and one or more other monomers for use as structural
resins. The resin composition is cured with the aid of
a radical-forming system that is unstable in the
10 temperature range of -20°C to $+110^{\circ}\text{C}$, and contains an
unsaturated prepolymer having an acid number of less
than 10 mg of KOH per g and a vinyl ether monomer
according to formula (I) or (II):

15 or

with A, R, R' and n having the described meanings. The
invention also relates to a process for the preparation
of such resin compositions and uses thereof.
